

DEFAULT ARGUMENTS

DEFAULT ARGUMENTS

- Goal: convenience and readability

DEFAULT ARGUMENTS

- Goal: convenience and readability
- Non-goal: subtle expressiveness

DEFAULT ARGUMENTS

- Goal: convenience and readability
- Non-goal: subtle expressiveness
- Guiding principle: defaults should be fully understandable without inspecting function body

BAD EXAMPLES WITH SCOPE

BAD EXAMPLES WITH SCOPE

- `function f(x = g()) { function g() {return 2*3}; ...}`

BAD EXAMPLES WITH SCOPE

- `function f(x = g()) { function g() {return 2*3}; ...}`
- `function f(x = g()) { let z = 2*3; function g() {return z}; ...}`

BAD EXAMPLES WITH SCOPE

- `function f(x = g()) { function g() {return 2*3}; ...}`
- `function f(x = g()) { let z = 2*3; function g() {return z}; ...}`
- `function g() { return 3*3; }`
`function f(x = g()) { function g() {return 2*3}; ...}`

BAD EXAMPLES WITH SCOPE

- `function f(x = g()) { function g() {return 2*3}; ...}`
- `function f(x = g()) { let z = 2*3; function g() {return z}; ...}`
- `function g() { return 3*3; }`
`function f(x = g()) { function g() {return 2*3}; ...}`
- `function f(x = eval("g()")) { function g() {return 2*3}; ...}`

BAD EXAMPLES WITH SCOPE

- `function f(x = g()) { function g() {return 2*3}; ...}`
- `function f(x = g()) { let z = 2*3; function g() {return z}; ...}`
- `function g() { return 3*3; }`
`function f(x = g()) { function g() {return 2*3}; ...}`
- `function f(x = eval("g()")) { function g() {return 2*3}; ...}`
- `function f(h = () => eval("g()")) { function g() {return 2*3}; h(); ...}`

BAD EXAMPLES WITH SCOPE

- `function f(x = g()) { function g() {return 2*3}; ...}`
- `function f(x = g()) { let z = 2*3; function g() {return z}; ...}`
- `function g() { return 3*3; }`
`function f(x = g()) { function g() {return 2*3}; ...}`
- `function f(x = eval("g()")) { function g() {return 2*3}; ...}`
- `function f(h = () => eval("g()")) { function g() {return 2*3}; h(); ...}`
-

BAD EXAMPLES WITH STATE

BAD EXAMPLES WITH STATE

- function f(x, g = () => x) { ... } // f(2) === f(2, () => 2) ?

BAD EXAMPLES WITH STATE

- function f(x, g = () => x) { ... } // f(2) === f(2, () => 2) ?
- function f(x, g = () => x) { x = 0; g(); ... }

BAD EXAMPLES WITH STATE

- `function f(x, g = () => x) { ... } // f(2) === f(2, () => 2) ?`
- `function f(x, g = () => x) { x = 0; g(); ... }`
- `function f(g = () => (z = 0)) { let z = 2; g(); ... }`

BAD EXAMPLES WITH STATE

- `function f(x, g = () => x) { ... } // f(2) === f(2, () => 2) ?`
- `function f(x, g = () => x) { x = 0; g(); ... }`
- `function f(g = () => (z = 0)) { let z = 2; g(); ... }`
- `function f(x, g = () => (x = 0)) { x = 2; g(); ... }`

SOLUTION

- Idea: defaults should behave as if provided by a wrapper function
 - cannot access internal function scope
 - cannot interfere with internal function state

SOLUTION

- Evaluate defaults in separate scope:
 - can see 'this', 'arguments' and function name (where applicable)
 - and other parameters (more on this in a minute)
 - but not variables from function body
 - not even later (via eval)

BAD EXAMPLES WITH EVALUATION ORDER

BAD EXAMPLES WITH EVALUATION ORDER

- function $f(x = y, y = 2) \{ \dots \}$

BAD EXAMPLES WITH EVALUATION ORDER

- `function f(x = y, y = 2) { ... }`
- `function f(x = eval("y"), y = 2) { ... }`

BAD EXAMPLES WITH EVALUATION ORDER

- `function f(x = y, y = 2) { ... }`
- `function f(x = eval("y"), y = 2) { ... }`
- `function f(x = (y = 3, 1), y = 2) { ... }`

BAD EXAMPLES WITH EVALUATION ORDER

- `function f(x = y, y = 2) { ... }`
- `function f(x = eval("y"), y = 2) { ... }`
- `function f(x = (y = 3, 1), y = 2) { ... }`
- `function f(x = (y = undefined, 1), y = 2) { ... }` `f(undefined, 3)`

SOLUTION

SOLUTION

- Parameters have a temporal dead zone:
 - initialised in sequence
 - default expression evaluated only if resp. value is undefined
 - backwards reference okay, forward raises `ReferenceError`
 - but can use 'arguments' if desired

SOLUTION

- Parameters have a temporal dead zone:
 - initialised in sequence
 - default expression evaluated only if resp. value is undefined
 - backwards reference okay, forward raises `ReferenceError`
 - but can use 'arguments' if desired
- Safer alternative: separate nested scope for each parameter. Cost?

IN A NUTSHELL

- Defaults evaluate “as if” provided by wrapper function:

```
function f({a: a = 9}, x = 1, y = x + 2) { ... }
```

behaves roughly like

```
function f() {  
  const {a: a = 9} = arguments[0]  
  const x = arguments[1] !== undefined ? arguments[1] : 1  
  const y = arguments[2] !== undefined ? arguments[2] : x + 2  
  return ((a, x, y) => { ... })(a, x, y) // lexical 'this' and 'arguments'  
}
```

- Glossing over ‘length’ and some other details here

IN THE SPEC

IN THE SPEC

- Fairly small change to current draft:

IN THE SPEC

- Fairly small change to current draft:
 - on `[[Call]]`, first create new environment for default evaluation

IN THE SPEC

- Fairly small change to current draft:
 - on `[[Call]]`, first create new environment for default evaluation
 - populated with parameters (uninitialised), 'this', 'arguments', function name

IN THE SPEC

- Fairly small change to current draft:
 - on `[[Call]]`, first create new environment for default evaluation
 - populated with parameters (uninitialised), 'this', 'arguments', function name
 - pop environment before evaluating function body

IN THE SPEC

- Fairly small change to current draft:
 - on `[[Call]]`, first create new environment for default evaluation
 - populated with parameters (uninitialised), 'this', 'arguments', function name
 - pop environment before evaluating function body
 - but “copy” over bindings to local environment

IN THE SPEC

- Fairly small change to current draft:
 - on `[[Call]]`, first create new environment for default evaluation
 - populated with parameters (uninitialised), 'this', 'arguments', function name
 - pop environment before evaluating function body
 - but “copy” over bindings to local environment
- Alternative to copying: *nest* local environment into parameter environment + hacks for 'var'

IN THE SPEC

- Fairly small change to current draft:
 - on `[[Call]]`, first create new environment for default evaluation
 - populated with parameters (uninitialised), 'this', 'arguments', function name
 - pop environment before evaluating function body
 - but “copy” over bindings to local environment
- Alternative to copying: *nest* local environment into parameter environment + hacks for 'var'
- Either way, extra environment only observable when a default contains either direct eval or a closure over one of the parameters

IN THE SPEC

- Fairly small change to current draft:
 - on `[[Call]]`, first create new environment for default evaluation
 - populated with parameters (uninitialised), 'this', 'arguments', function name
 - pop environment before evaluating function body
 - but “copy” over bindings to local environment
- Alternative to copying: *nest* local environment into parameter environment + hacks for 'var'
- Either way, extra environment only observable when a default contains either direct eval or a closure over one of the parameters
- Hence easy to optimise away in most cases
